Introduction

The West Gulf Coastal Plain of Southwest Arkansas is home to a great diversity of burrowing crayfishes. Recent studies have improved our knowledge of many of the crayfish species in the Ouachita Mountains, but our knowledge remains poor with regard to species specifically inhabiting the West Gulf Coastal Plain portion of the state. Two state endemic species which occur there, namely *Procambarus regalis* and *Fallicambarus petilicarpus* (Robison and Allen, 1995) are of particular interest as is *Faxonella blairi*, an uncommon crayfish species of this geographic area.

Procambarus regalis was considered to be of “Special Concern” by Taylor et al. (1996) and ranked G2G3S2S3 by The Nature Conservancy. *Fallicambarus petilicarpus* was considered to be endangered by Taylor et al. (1996) and ranked G1S1 by The Nature Conservancy. Previous to this study it was only known from its type locality. There is currently insufficient information available to plan for the conservation of either of these species or to determine the relative importance of their protection. *Faxonella blairi* is one of the most poorly known crayfishes in Arkansas. This rare crayfish has been found only in southwest Arkansas and southeast Oklahoma (Hayes and Reimer, 1977; Hobbs, 1989). The ecological and genetic relationships between *Faxonella blairi*, *Faxonella clypeata*, and species of the genus *Cambarellus* are not known. The species (*Faxonella blairi*) is recorded from southwest Arkansas, based on a single documented collection held in the U. S. National Museum (Smithsonian). Taylor et al. (1996) consider it to be stable and The Nature Conservancy ranks it as G2S1. There is presently not enough information available to plan for the conservation of this species or determine relative

importance of its protection. In addition to data on these three species, the genetic analysis of *Bouchardina robisoni* is included in this final report as addendum to a report by Robison (2006) on the distribution and conservation status of *B. robisoni*.

Objectives

The intention of this present study was to accurately portray the current conservation status, distribution, and genetics of four southwestern Arkansas crayfishes, namely *Procambarus regalis*, *Fallicambarus petilicarpus*, *Bouchardina robisoni*, and *Faxonella blairi*. Specific objectives of the study were:

1. To establish a baseline distribution and conservation status of three crayfishes: *Procambarus regalis*, *Fallicambarus petilicarpus*, and *Faxonella blairi*;
2. To employ genetic analyses to clarify the taxonomic status of these three crayfish species, plus *Bouchardina robisoni*, relative to other species in their respective genera; and
3. To document the diversity and distribution of the burrowing crayfish fauna in areas of the West Gulf Coastal Plain of Arkansas.

Methods and Materials

Field work was conducted from March, 2006 through the spring and into May, 2007. The majority of collections were made during March, April, May and continued into mid-May, 2007 when wet conditions were optimal. Two of the three species (*Procambarus regalis* and *Fallicambarus petilicarpus*) are primary burrowers, i.e. they burrow all year long in one place and rarely exit, thus to collect specimens it is necessary to physically remove them once the burrow is discovered. While the digging of burrows can be quite laborious, it generally remains

the most reliable method known to collect primary burrowing crayfishes. The other species, *Faxonella blairi*, frequents backwater areas of small streams and roadside ditches and can be collected by catching it by hand or with a aquatic dip nets.

Other methods supplemented digging of burrows and hand picking including baited strings and crayfish traps; however, both excavation and hand collecting proved to be superior methods of collecting specimens.

Specimens used for describing the geographic range of each species were initially preserved in 95% isopropyl alcohol and later transferred to the Brigham Young University Monte L. Bean Life Science Museum's crustacean collection after identification to species.

Collection efforts were centered in southwestern Arkansas where the three species are known to occur. Collections were made in 10 counties throughout the West Gulf Coastal Plain namely, Columbia, Union, Hempstead, Howard, Lafayette, Little River, Miller, Nevada, Ouachita, and Sevier counties. A total of 73 collections were made from the 10 counties to determine the geographic ranges of the three crayfish species in Arkansas.

In addition to field collections in 2006 -2007 by the two Co-Investigators, collections housed at Southern Arkansas University were examined for specimens of any of the three target species as was the on line computerized database of crayfishes at the Smithsonian Institution. All previous literature dealing with the three crayfish species in Arkansas was also consulted.

For genetic analyses, gill tissue was dissected from crayfish specimens and preserved in 95% EtOH for DNA extraction. DNA was extracted using standard protocols and a ~500 base pair highly variable segment of the 16S gene of the mitochondrial genome was PCR amplified using the methods and primers described in Crandall and Fitzpatrick (1996). Sequences were obtained from all populations collected of all three target species plus many of the associated species and taxonomic relatives for phylogenetic comparison. Sequences were aligned using the software Clustal X and phylogenetic analyses were performed in PAUP*. A neighbor-joining

tree using the GTR+G model of evolution was estimated from the complete data set and node confidence was assessed using the bootstrap procedure.

Results and Discussion

Procambarus regalis

Originally, the crayfish, *Procambarus regalis*, was described by Hobbs and Robison (1988) from eight collections from Howard, Nevada, and Sevier counties. The specimens were deposited in the collection of the United States National Museum. Robison and Allen (1995) noted this crayfish was an Arkansas endemic species.

Distribution

Previously, the distribution of *Procambarus regalis* was known only from eight localities from Howard, Nevada, and Sevier counties, Arkansas. The type-locality is: **Arkansas: Nevada County:** (1) DeAnn Cemetery about one mile west of the junction of St. Hwys. 19 and 24 on St. Hwy. 24 at the western edge of the city limits of Prescott, Arkansas. 16 March 1982. Elaine Laird. Seven other localities are known: (2) **Howard Co.:** Mineral Springs, 2 form 1 males. May 1986. Kyle Erwin and Jason Erwin. (3) 2 miles south of Mineral Springs, 1 male form II, Linda Tate. 1985. (4) 1.4 miles south of St. Hwy. 27 on St. Hwy. 317. 1 juvenile male. 2 May 1986. Henry W. Robison. (5) **Sevier Co.:** (5) Roadside wet area 5.1 miles east of Oklahoma state line on U.S. Hwy. 70. 21 April 1973. J. Pugh, G. B. Hobbs, and H. H. Hobbs, Jr. 2 juvenile males, 5 juvenile females. (6) field 1.5 miles north of Paraloma (Sec. 8, T11S, R28W). 1 female. 1 April 1987. Eddie Daniels and H. W. Robison. (7) Seepage area 1.6 miles southwest of the junction of St. Hwy. 27 and 234. 1 male form II, 3 females, 2 juvenile males, and 1 juvenile female. 20 April 1987. G. B. Hobbs and H. H. Hobbs, Jr. (8) Roadside ditch 0.4 miles east of the Oklahoma state line. 1 form I male, 1 form II male, 2 females, 10 juvenile males, 12 juvenile

females. 21 April 1973. J. E. Pugh, G. B. Hobbs, and H. H. Hobbs.

Searches of the 10 counties throughout the West Gulf Coastal Plain revealed the presence of nine new populations of this crayfish all in Sevier County and Howard County, Arkansas. New populations discovered during this study are as follows: **Sevier Co.:** Roadside wet area 5.1 miles east of Oklahoma state line on U.S. Hwy. 70. 16 March 2007. H. W. Robison. **Sevier Co.:** Roadside ditch on St. Hwy. 317, 3 miles southeast of the junction of St. Hwy. 317 and US Hwy. 71 (Sec. 6, T10S, R29W). 20 April 2007. Henry W. Robison. **Sevier Co.:** Roadside ditch on St. Hwy. 317, 2.5 miles southeast of the junction of St. Hwy. 317 and US Hwy. 71 (Sec. 31, T9S, R29W). 20 April 2007. Henry W. Robison. **Sevier Co.:** Roadside ditch on U.S. Hwy. 70, 7 miles west of DeQueen, AR (Sec. 19, T8S, R32W). 31 March 2007. Henry W. Robison. **Sevier Co.:** Roadside ditch on U.S. Hwy. 70, 5 miles west of DeQueen, AR. (Sec. 21, T8S, R32W). 27 April 2007. Henry W. Robison. **Sevier Co.:** Roadside ditch on U.S. Hwy. 70, 3.1 miles west of DeQueen, AR. (Sec. 26, T8S, R32W). 24 March 2007. Henry W. Robison. **Sevier Co.:** Roadside ditch on U.S. Hwy. 70, 4 miles west of DeQueen, AR. (Sec. 27, T8S, R32W). 21 April 2007. Henry W. Robison. **Howard Co.:** Seepage area, 1.5 miles west of Mineral Springs, AR on St. Hwy. 27 (Sec. 23, T10S, R29W). 30 May 2006. Henry W. Robison **Howard Co.:** Roadside ditch 2 miles north of Tollette, AR on St. Hwy. 355 (Sec. 28, T10S, R29W). 15 April 2006. Henry W. Robison.

In summary, the distribution for *Procambarus regalis* after this study is 17 localities in three counties (Howard, Nevada, and Sevier counties) in Arkansas (Table 1). Nine new populations were discovered in Sevier and Howard counties, Arkansas. At each of these nine

new locations, *Procambarus regalis* was found to be a highly localized and a locally uncommon crayfish.

Habitat

Procambarus regalis is a primary burrower, i.e. it burrows all year long in one place and rarely exits except during the breeding season when males search for females. This species was never collected in static open water in fields or in ditches with standing water, but rather always only from burrows. Burrow tended to be simple in construction and depths of capture ranged from 1-2.5 feet. Soils where burrows were found tended to be of a sandy clay without standing water. Roadside ditches, because of their propensity to hold water seasonally, are a favorite habitat type for this species.

Crayfish Associates

During the collection portion of this study four additional species of crayfishes were collected while searching for *Procambarus regalis*, namely, *Cambarus ludovicianus*, *Fallicambarus fodiens*, *Faxonella blairi*, and *Procambarus acutus*.

Conservation Status

Taylor et al. (1996) published a paper entitled "Conservation Status of crayfishes of the United States and Canada" which provides the most current conservation assessment dealing with crayfishes. In that paper they found 19.2 percent of the crayfish fauna in the United States and Canada endangered, while 13.3 percent was threatened and 14.8 percent considered as special concern. While 52.0 percent or 176 of the 338 native crayfishes were considered "stable," 48.0 percent or 162 species were in need of some conservation status.

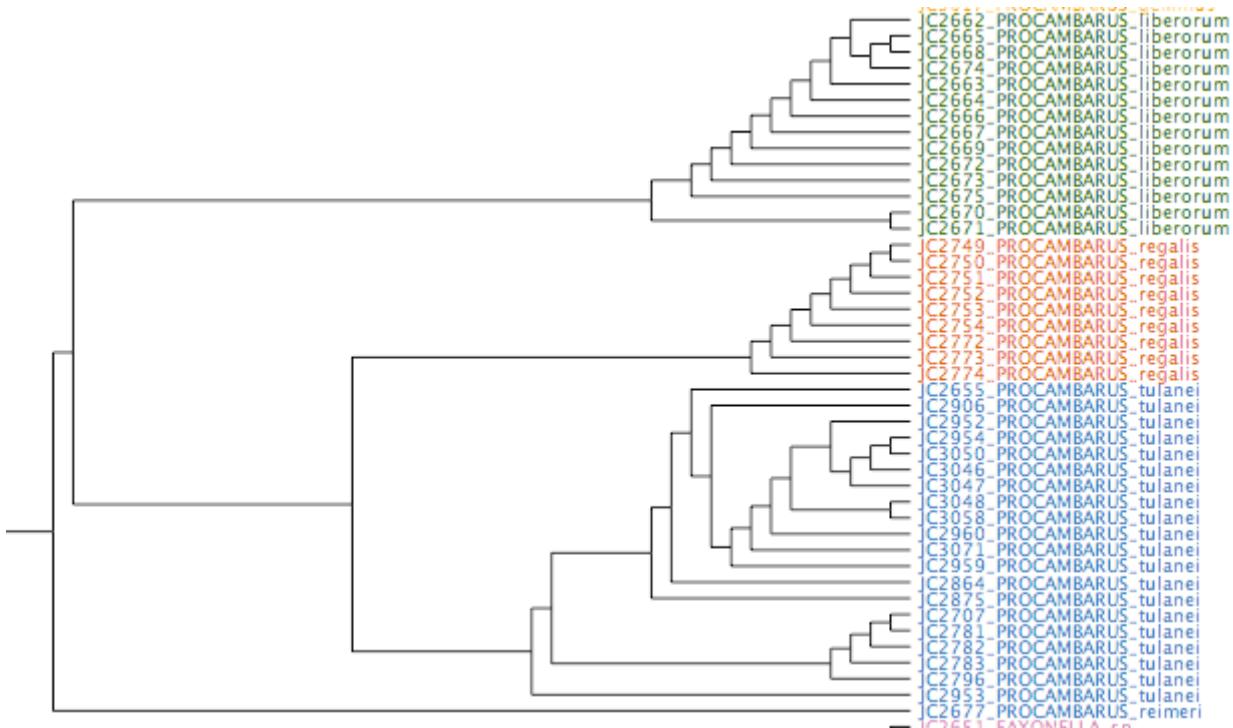

In their report, Taylor et al. (1996) listed *Procambarus regalis* as "Special Concern" based on the best information available at the time. In the present survey *P. regalis* remained an

uncommonly collected species. Using the more globally accepted criteria of the International Conservation Union (IUCN 2001), we recommend this species be listed in the IUCN Red List as “Vulnerable” based on criteria B2a,biii with respect to our data. On the basis of these new data, it is the further recommendation of the two Co-Investigators that *Procambarus regalis* should be continued in a status of “Special Concern” for the state of Arkansas where it can be monitored in future years to determine if the population increases or declines.

Genetic Analyses

The genetic samples of *Procambarus regalis* all clustered together and showed similar within species genetic diversity as *Procambarus liberorum* (Figure 1 [subclade], Appendix 1 [total phylogeny]). *P. regalis* samples formed a single monophyletic clade, sister to *Procambarus tulanei*. The (*P. regalis*, *P. tulanei*) clade was then sister to *P. liberorum*, and that clade sister to a single representative of *P. remeri*. The (*P. remeri*, (*P. liberorum*, (*P. regalis*, *P. tulanei*) clade was then sister to *Procambarus geminus*. *P. geminus* showed substantial genetic structure within the clade suggestive of cryptic species within this clade. The genetic results clearly support *P. regalis* as a distinct species with ample genetic diversity within the species. Because of the relatively small sample sizes from this reclusive species, it is difficult to assess population structure within this species. This genetic variability should also be monitored with future studies to be sure it does not decrease and thereby increase the probability of extinction of this species (Spielman et al. 2004). Likewise, further within species sampling should be undertaken to determine the extent of population substructuring within the species. Finally, further studies should further examine the genetic structure of *P. geminus* and explore the potential for cryptic species within this lineage.

Figure 1. Subclade showing the monophyly of *Procambarus regalis* relative to other selected *Procambarus* species.

Fallicambarus petilicarpus

Hobbs and Robison (1989) described *Fallicambarus petilicarpus* from specimens captured in burrows in a roadside seepage in Union County, southwestern Arkansas first collected in the spring of 1982. This crayfish is an Arkansas endemic (Robison and Allen, 1995) known only from Union County, Arkansas.

Distribution

Hobbs and Robison (1989) initially found *Fallicambarus petilicarpus* in a single location near the Columbia – Union County line in Union County, Arkansas. The type locality for *Fallicambarus petilicarpus* is: **Union Co.:** (1) **Type-Locality:** Roadside seepage 0.2 mile east of the Columbia County line on St. Hwy. 57, Union County, Arkansas (Sec. 21, T16S, R18W). Henry W. Robison. April 30, 1982.

Searches of the 10 counties throughout the West Gulf Coastal Plain revealed the presence of only a single new population of this crayfish in Union County (Table 2). The new population is as follows: **Union County :** (1) Wet area along U.S. Hwy. 82 in Marysville, Arkansas.

An intriguing discovery was made in eastern Union County east of El Dorado along U.S. Hwy. 82 (See Table 2). The specimens appear to be *Fallicambarus petilicarpus*, but they differ genetically (Jen Buhay, pers. comm.). To be totally certain about its identification to the specific level will require a trip to the Smithsonian Institution collection to compare the DNA of the type series of *Fallicambarus petilicarpus* with the specimens collected during this study.

In summary, *Fallicambarus petilicarpus* after this study is known from only two localities in one county, Union County, Arkansas. One new population was discovered in Union County during this study, plus another possible locality in eastern Union County, east of El Dorado, AR; however, at each of these locations, *Fallicambarus petilicarpus* was found to be a highly localized and locally uncommon crayfish.

Habitat

Fallicambarus petilicarpus is a primary burrower and remains in the burrow all year long except for short forays out to search for females to reproduce in the breeding season. It has not been collected in standing water. Burrows of *Fallicambarus petilicarpus* are relatively shallow and complex structures which are constructed in sandy loam soil and topped by chimneys from

8-10 cm tall. Burrows are normally from one to 1.5 feet deep and often penetrate tangled dense root mats of grasses growing in and on the banks of the roadside ditches they inhabit.

Biological Aspects

First form males of *Fallicambarus petilicarpus* have been collected in March and April (Hobbs and Robison 1989). No ovigerous females nor females carrying young have been found to date. The largest specimen is a female having a carapace length of 41.5 (postorbital carapace length 36.0) mm. The largest and smallest first form males have lengths of 39.4 (33.9) mm and 31.6 (26.6) mm, respectively.

Crayfish Associates

Four additional species of crayfishes were collected while searching for *Fallicambarus petilicarpus* including, *Cambarus ludovicianus*, *Procambarus acutus*, *Procambarus tulanei*, and *Faxonella clypeata*.

Conservation Status

In their report, Taylor et al. (1996) listed *Fallicambarus petilicarpus* as "endangered" based on the best information available at the time. In our survey it is apparent that *Fallicambarus petilicarpus* is indeed a rare member of the West Gulf Coastal Plain crayfish fauna and confined to Union County, Arkansas. The IUCN has previously listed *F. petilicarpus* as Vulnerable based on criteria B1+2ciii and D1. Based on our results, this is still an appropriate categorization for this species. On the basis of this additional information and our collecting effort, it is our recommendation that *Fallicambarus petilicarpus* continue to be considered as an "endangered" Arkansas endemic and that monitoring of this crayfish species be continued.

Genetic Analyses

The samples of *Falicambarus petilicarpus* not only form a monophyletic clade (Figure 2), but this clade is exceptionally distinct from any other clades, including other members of the genus *Falicambarus* (Appendix 1 – total phylogeny). Indeed, the amount of genetic diversity separating this species from others is equivalent to the separation of other genera of freshwater crayfish. Within this clade, there is substantial genetic structuring. We obtained a single sample of *Falicambarus dissitus* from Columbia County which clusters within the *Falicambarus petilicarpus* clade. This begs the question of the distinctiveness of *F. dissitus*. However, the amount of genetic diversity between this species and the containing clade of *F. petilicarpus* is consistent with other crayfish species differences. But this would mean that there are five distinct species in this particular subclade. Clearly, further sampling is warranted of *Falicambarus dissitus* to get a reasonable handle on the relative amounts of genetic diversity within versus among these species. Note also that samples from what was thought to be an undescribed species of *Procambarus* from Little River County with noted blue legs, clusters as a basal sister taxon to the *Falicambarus petilicarpus* clade. Thus, there appears to be at least two very distinct species here and probably more and this clade as a whole is exceptionally distinct (genetically) relative to other crayfish genera. Further sampling is warranted for the “blue legs” species from Little River County, *Falicambarus dissitus* to examine its distinctiveness relative to *F. petilicarpus*, and of *F. petilicarpus* itself to discern whether the substantial genetic structure within the species is due to sampling artifact or simply because the species is highly fragmented in its distribution.

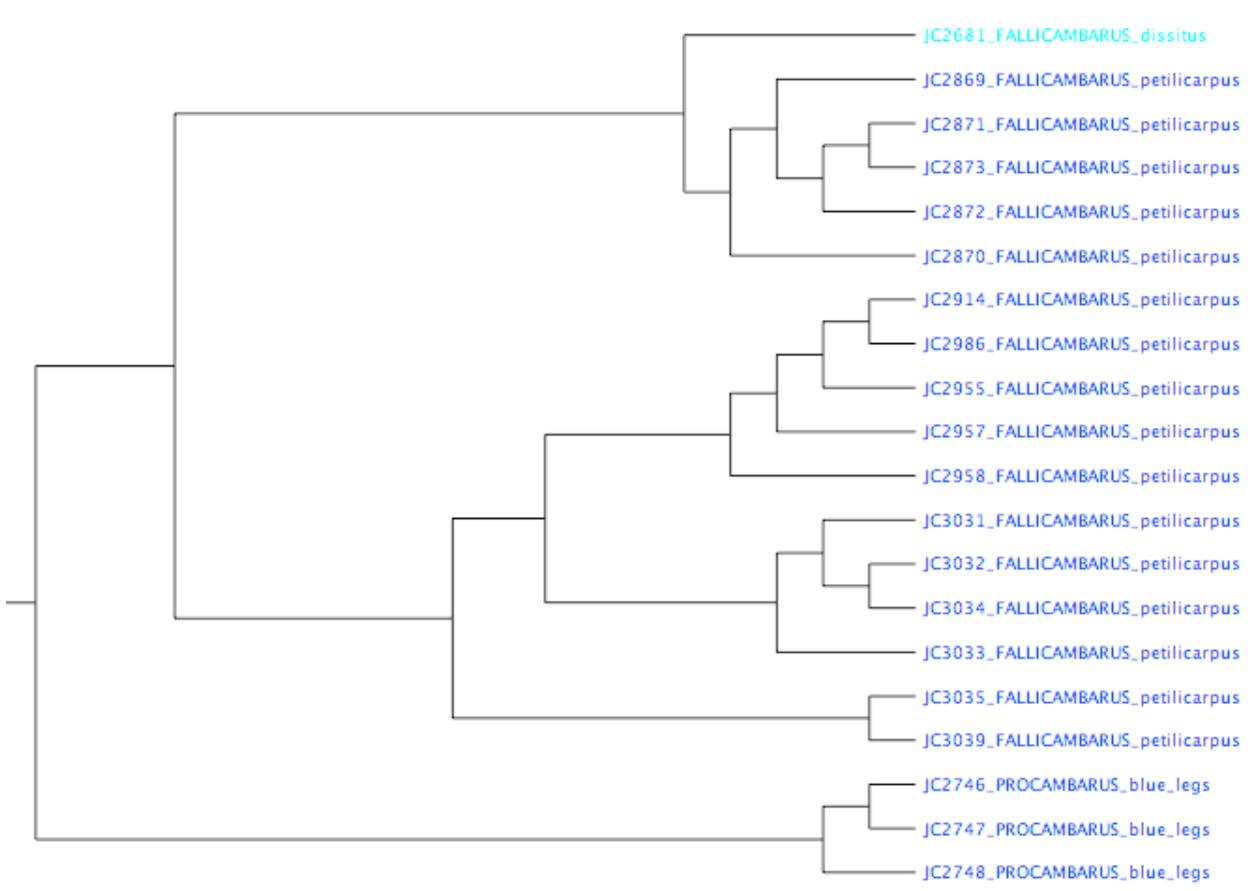

Figure 2. Subclade of *Fallicambarus petilicarpus* with a single sample of *F. dissitus* and an undescribed species from Little River County. This clade is significantly phylogenetically distinct from all other clades in the overall phylogeny (see Appendix 1).

Faxonella blairi

Hayes and Reimer (1977) described *Faxonella blairi* from the Little River drainage of southeastern Oklahoma and southwestern Arkansas. The type locality is a woodland swamp 100 yards west of U.S. Hwy. 259 on north side of the Little River, seven miles south of Broken Bow, McCurtain County, Oklahoma. Little has been published since concerning this tiny crayfish and thus it appeared when this study was initiated that this crayfish was quite rare in Arkansas. In

order to make sure workers are aware of the differences between *Faxonella blairi* and the more common crayfish relative, *Faxonella clypeata*, the diagnosis from the original description is provided below of *Faxonella blairi*.

Diagnosis

Hayes and Reimer (1977) described the distinguishing characters of *Faxonella blairi* which included the annulus ventralis of the *F. blairi* female which is firmly embedded in the sternum, much more than in other species of *Faxonella* and the sinus simpler in sculpture. In these features, *F. blairi* is more similar to *F. creaseri* than to either *F. clypeata* or *F. beyeri*. The females of *F. blairi* can easily be distinguished from other species of *Faxonella* by the prominent caudal lip of the annulus ventralis.

Male *F. blairi* can be distinguished from all other *Faxonella* species by the more straight central projection of *F. blairi* which reaches to the coxae of the first pereiopod. In *F. creaseri*, the central projection reaches basically to the same level, but the distal half of the ramus is bent more mesially. In *F. clypeata*, the mesial process is much shorter and more crowded.

Distribution

Faxonella blairi is an inhabitant of southwestern Arkansas and southeastern Oklahoma. Our study indicates that this crayfish is far more widespread and much more common than formerly believed. Searches throughout southwestern Arkansas revealed the presence of 36 new populations of this crayfish. New populations discovered during this study are as follows:
AR: **Sevier Co.**: Roadside wet area 5.1 miles east of Oklahoma state line on U.S. Hwy. 70. 28 April 2006. H. W. Robison, K. Crandall, B. Wagner, J. Buhay, and M. Kottmyer. Sevier Co.:

Roadside ditch on St. Hwy. 317, 3 miles southeast of the junction of St. Hwy. 317 and US Hwy. 71 (Sec. 6, T10S, R29W). 11 March 2006. Henry W. Robison. Sevier Co.: Roadside ditch on St. Hwy. 317, 2.5 miles southeast of the junction of St. Hwy. 317 and US Hwy. 71 (Sec. 31, T9S, R29W). 19 April 2007. Henry W. Robison. Sevier Co.: Roadside ditch on U.S. Hwy. 70, 7 miles west of DeQueen, AR (Sec. 19, T8S, R32W). 19 April 2007. Henry W. Robison. Sevier Co.: Roadside ditch on U.S. Hwy. 70, 5.2 miles west of DeQueen, AR. (Sec. 21, T8S, R32W). 15 March 2007. Henry W. Robison. Sevier Co.: Roadside ditch on U.S. Hwy. 70, 4 miles west of DeQueen, AR. (Sec. 27, T8S, R32W). 2 May 2006. Henry W. Robison. Sevier Co.: Roadside ditch on U.S. Hwy. 70, 3.1 miles west of DeQueen, AR. (Sec. 26, T8S, R32W). 4 May 2006. Henry W. Robison. Sevier Co.: Clear Creek at St. Hwy. 24, 1 mile east of jct. of St. Hwy. 24 and St. Hwy. 41 (Sec. 30, T9S, R31W). 15 June 2006. Henry W. Robison. Sevier Co.: Roadside ditch on St. Hwy. 41, 1.1 mile south of Horatio, AR. (Sec. 2, T10S, R32W). 18 June 2006. Henry W. Robison. Little River Co.: Roadside ditch south of Horatio, AR 33.88128 -94.41887 NAD27. 28 April 2006. H. W. Robison, K. Crandall, B. Wagner, J. Buhay, and M. Kottmyer. **Little River Co.**: Roadside ditch on St. Hwy. 41, 4 miles south of Horatio, AR. (Sec. 16, T10S, R32W). 21 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 234, 2 miles east of Winthrop, AR. (Sec. 17, T11S, R31W). 21 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 32, 7 miles west of Ashdown, AR. (Sec. 1, T13S, R31W). 21 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 32, 5.2 miles west of Ashdown, AR. (Sec. 5, T13S, R30W). 22 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 41, 6.3 miles south of Horatio, AR. (Sec. 28, T10S, R32W). 24 March 2006. Henry W. Robison. Little

River Co.: Roadside ditch on St. Hwy. 41, 2 miles south of Cross Roads, AR. (Sec. 14, T11S, R32W). 24 March 2006. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 41, 3 miles south of Cross Roads, AR. (Sec. 22, T11S, R32W). 24 March 2006. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 234, 1 mile west of Winthrop, AR. (Sec. 2, T11S, R31W). 24 March 2006. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 234, 3.5 miles east of Winthrop, AR. (Sec. 22, T11S, R31W). 20 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 234, 1.5 miles west of Alleene, AR. (Sec. 27, T11S, R31W). 20 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 234, 1 mile west of Alleene, AR. (Sec. 26, T11S, R31W). 20 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 234, 4 miles west of Wilton, AR. (Sec. 4, T12S, R32W). 20 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 41, 2 miles north of Foreman, AR. (Sec. 3, T12S, R32W). 20 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 41, 4 miles south of Cross Roads, AR. (Sec. 27, T11S, R32W). 21 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 41, 1 mile north of Foreman, AR. (Sec. 11, T12S, R32W). 21 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 32 at Wallace, AR. (Sec. 36, T12S, R31W). 21 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 32, 4 miles east of Foreman, AR. (Sec. 6, T13S, R31W). 21 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 32, 7.5 miles east of Foreman, AR. (Sec. 2, T13S, R31W). 21 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 41, 7.2 miles south of Horatio, AR. (Sec. 30, T10S, R32W). 21 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 41, 1 mile south of Cross Roads, AR. (Sec. 11,

T11S, R32W). 21 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 32, 2 miles west of Ashdown, AR. (Sec. 3, T13S, R30W). 27 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 32, 1.1 miles west of Ashdown, AR. (Sec. 1, T13S, R30W). 27 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on co. road, 4 miles south of Ashdown, AR. (Sec. 19, T13S, R29W). 27 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on U.S. Hwy. 71, 1.5 miles south of Ashdown, AR. (Sec. 9, T13S, R29W). 27 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 32, 5 miles east of Foreman, AR. (Sec. 5, T13S, R31W). 28 April 2007. Henry W. Robison. Little River Co.: Roadside ditch on St. Hwy. 32, 6 miles east of Foreman, AR. (Sec. 4, T13S, R31W). 28 April 2007. Henry W. Robison.

In summary, the distributional range for *Faxonella blairi* after this study is only two counties in Arkansas, namely, Little River and Sevier counties. Thirty-six new populations were discovered in Little River and Sevier counties (Table 3). At each of these locations, *Faxonella blairi* was found to be a locally abundant crayfish.

Habitat

Hayes and Reimer (1977) described the habitat of this species as turbid, shaded, static water areas with an average of 12 inches in depth. This species is not found in running water. It is a secondary burrower and will burrow when waters levels recede.

Crayfish Associates

During the collection portion of this study six additional species of crayfishes were collected

while searching for *Faxonella blairi* namely, *Fallicambarus fodiens*, *Cambarus ludovicianus*, *Procambarus geminus*, *Procambarus regalis*, *Procambarus curdi*, and an undescribed *Procambarus (Girardiella)* species we called the “Green legs form” because of its beautiful green appendages.

Conservation Status

Faxonella blairi was listed by Taylor et al. (1996) as “Currently Stable.” After extensive collecting in southwestern Arkansas, we agree that *Faxonella blairi* should be considered as “Currently Stable” due to its more widespread distribution than previously believed and general abundance throughout its range in southwestern Arkansas. Under the IUCN criteria, this species should be listed as “Least Concern”.

Genetic Analyses

The samples of *Faxonella blairi* form a monophyletic group that has a sister relationship to *Faxonella clypeata* (Appendix 1). Within *Faxonella blairi* there is considerable genetic variation with three distinct lineages with the two main lineages corresponding mostly, but not 100%, with the two sampling localities (Figure 3). The third distinct lineage is from a single juvenile sampled at the same Little River County location as the other, but has considerable genetic distance from the other samples. In our sampling for *F. blairi*, we sampled *F. clypeata* extensively. Samples we thought might have been *F. blairi* from other locations and counties, turned out to be genetically more closely related to *F. clypeata*. However, the genetic diversity contained within the *F. clypeata* clade is equivalent to other genera with many species. Thus,

these preliminary data suggest that *F. clypeata* might be a large and genetically diverse species complex that is in dire need of further study. As for *F. blairi*, the genetic results suggest that the species is geographically localized to just two counties, but has extensive genetic variation within the species.

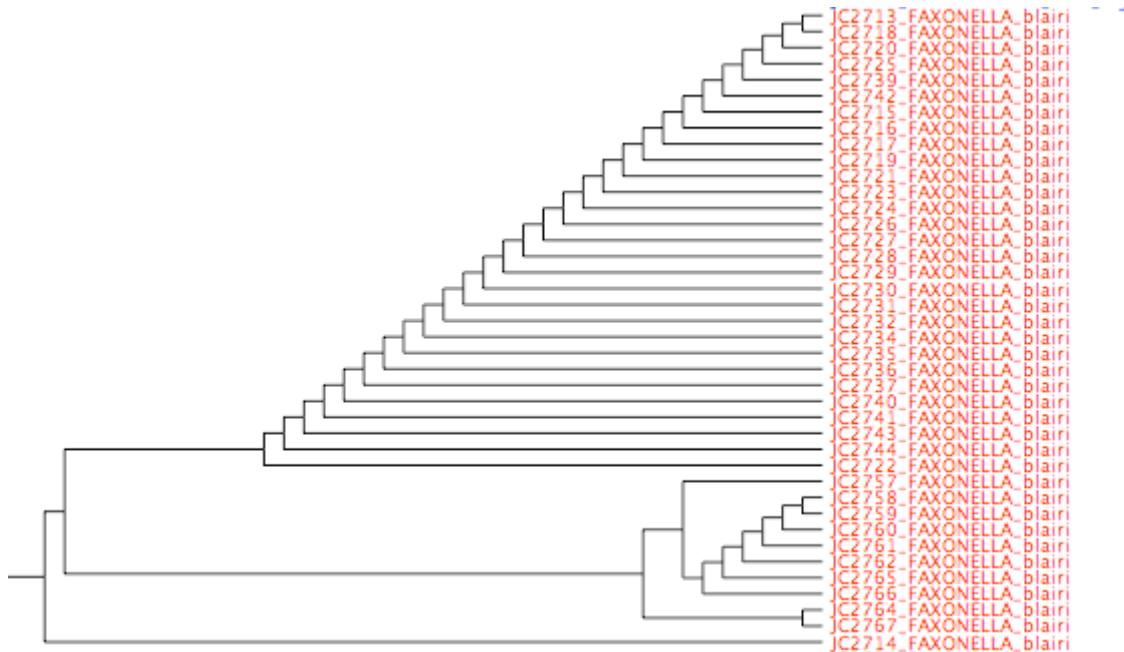

Figure 3. Phylogeny of *Faxonella blairi* showing samples from this species form a monophyletic group sister to *Faxonella clypeata* with extensive, but relatively unstructured, genetic variation within species.

ADDENDUM TO REPORT – Genetic status of *B. robisoni*

Bouchardina robisoni

The crayfish *Bouchardina robisoni* was originally described in 1977 by the late Dr. Horton H. Hobbs, Jr., of the Smithsonian Institution (Hobbs, 1977) from specimens collected in Lafayette County, Arkansas by Dr. Henry W. Robison. This crayfish species has proven to be an Arkansas state endemic (Bouchard and Robison, 1981; Robison and Allen, 1995), occurring

nowhere else in the world, and few collections have been made of this species since 1977. The only known published photograph of *B. robisoni* remains that published in Lukhaup (2003) taken by Dr. Hobbs in 1977.

Distribution

Hobbs (1976) described the type locality of *Bouchardina robisoni* as backwaters of Bayou Bodcaw (=Bodcau) in Lafayette County, Arkansas about 3.5 miles north of Lewisville, Arkansas. This stream is alternatively spelled “Bodcaw” and “Bodcau.” In the original description (Hobbs, 1976), it was labeled “Bayou Bodcaw.” Recently, Robison (2006) surveyed this species in southwestern Arkansas and this information is reported elsewhere.

Genetic Analysis

We sampled *Bouchardina robisoni* from two locations with extensive sampling at each location (as this species is locally abundant when found). These samples showed an extraordinary amount of genetic diversity with absolutely no genetic structure (see Appendix 1). We've never seen such genetic variation with such a lack of genetic structure in a crayfish species before. More extensive phylogenetic analyses are required to verify that this is a real biological phenomenon and not an artifact of spurious data. A potential biological explanation is one of a parthenogenetic lineage, which is not unknown in freshwater crayfish (Scholtz et al. 2003).
